How PCA works

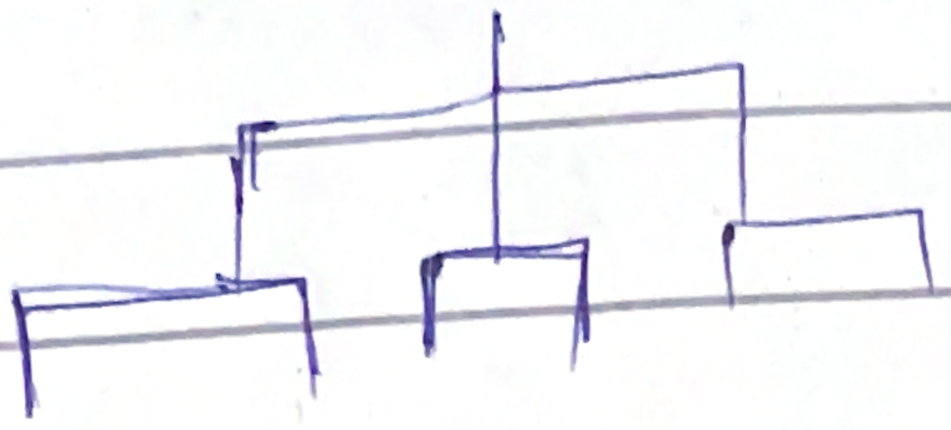

pca → preprocessing technique for reducing no. of features and gaining the best no. of features / dataset parts.

e.g: age , date of birth

↳ unsupervised learning

combine these two columns and if possible give resulted value to new column.

Random Forest :-

↳ boot strap sampling

trees getting out the results conduct votes RF ~~votes~~ and then decide datapoint belongs to which class.

↳ apply correlation before applying processing.

↳ Random F classification] supervised ML

↳ RF Regression
