LAB - 04

KNN Algorithm

↳ It performs classification & regression

↳ Prediction

↳ Dataset → Distance.

Eucledean

Manhattan

Regression

→ Calculate distance of every single data point.

→ Can take any values of k.

→ After testing, you can take suggested values

→ Data set features

→ Impact of k values

→ p values (1, 2, 3, 4, 5)

↳ for testing.

eg: p → value. 1 which distance will be applied.

p = 1 → Manhattan distance

p = 2 → Euclidean distance

p = 3 → Minkowski

p = 4 or 5

↳ Higher Order.
